

# LANGLEY

SUTTON COLDFIELD

## SUSTAINABLE DRAINAGE SYSTEMS

### LEGEND

 Indicative location of proposed strategic attenuation, including:

- Formal and informal attenuation features with permanent water;
- Formal and informal attenuation features predominantly dry (except in 1 in 30 to 1 in 100 year flood events);
- Swales, wet and dry, providing linear, connected, ecological elements.

 Existing watercourses remodelled to provide in-line water attenuation features and accommodate proposed level changes (Langley Brook).

 Existing and proposed water features, including:

- Watercourses to be retained as existing to ensure continued contribution to ecological features including the 'semi-improved neutral grassland with marshy grassland'.
- Ponds with Great Crested Newts (GCN);
- Wildlife ponds to be separate from the SuDS train, but not so big they'd attract flocking waterfowl, are found within the Site.
